

This documentation encapsulates my comparison between my personal profile implemented using only HyperText Markup Language (HTML) and my personal profile implemented using HTML and Cascading Style Sheets (CSS). Subsequently, I will provide my reflection while creating my second Machine Exercise (ME) and answer the question: "What makes CSS a superior approach to styling web pages compared to relying purely on HTML attributes?"

< My Personal Profile >	
Pijey Alcantara	
	Full Name: Fernando Dela Torre Alcantara Jr. Birthday: March 30, 2007 Status: Student
Hobbies	• Arts • Running, Badminton, and Taekwondo • Makinig sa underground OPM bands (hell <i>nyeah</i>)
Top 3 movies	1. Like stars on earth (2007) 2. IDILY (2017) 3. 100 awit para kay stella (2017)
Favorite Quote	<u>"salamat UP!"</u>
Fun Fact	I love Bita and the Botflies (stream their songs pls)
Github Profile Behance Profile	

Figure 1. My Personal Profile implemented in HTML

During the first ME, we were tasked with creating our personal profile using HTML only, recreating the instructor's personal profile and personalizing it based on our information. I finished this exercise quickly as I have a prior background in web development using HTML, CSS, and JavaScript. My output is shown in Figure 1.

Figure 2: My Personal Profile implemented in HTML with CSS

Creating my second ME was, admittedly, my favorite part of this subject, as I could demonstrate my front-end and design skills. Through my choices of color, branding, and visual hierarchy, I created a visually appealing website, exhibited in Figure 2. Additionally, having a structured and organized workflow enhanced my productivity in finishing this ME.

Figure 3: Branding and UI making in Adobe Photoshop.

First, I created my assets and User Interface (UI) structure in Adobe Photoshop, as shown in Figure 3, establishing the branding and assets that I would be utilizing in the later part of development. Then, I refactored the whole HTML file, adding `<div>` tags, classes, and IDs, utilizing semantic HTML, implementing the hero section, and adding CSS to style my web page.

To manage the colors that I used on my web page, I created a `:root` pseudo-class to declare CSS variables for color consistency. Other than that, I also imported custom typography so that my personal branding would stand out.

Since it had been 6 months since I last used CSS, I had a hard time remembering some properties and values, leading me to look them up on the internet—specifically, [w3schools.com](https://www.w3schools.com), which is my primary reference for studying HTML, CSS, and JavaScript. I also researched how to implement a grid layout as a background.

Furthermore, when restructuring my HTML file, I removed the table layout and wrapped the content in `<div>` tags with class or ID names so that I could style them in CSS. It was not stated in the instructions that we needed to retain table elements, only the content itself. I also wanted to note that I placed my favorite quote in the hero section so that it would serve as an additional element introducing my identity right on the landing page of my website.

Considering the points I have raised, this leads me to reflect on CSS being a much better approach rather than relying purely on HTML attributes. CSS allows you to style your web page based on how you want it to be presented, whereas presentational HTML attributes are limited and largely deprecated. Without CSS, HTML follows a default flow where elements stack

top-to-bottom, making layout techniques like placing elements side-by-side difficult or impractical. CSS offers far more flexibility and variety in layout and design through the flexbox and other properties.

Furthermore, CSS is a much better choice for designing web pages compared to purely relying on HTML presentational attributes because CSS enables responsive web design across different screen sizes. This capability is vital for structuring a web page accessed across various browsers and devices. However, I did not implement responsive design in this exercise, as it was not required for this ME.

Lastly, to back up my claim, CSS allows you to style multiple HTML pages using a single external stylesheet linked to each document. This significantly reduces redundant work, as one CSS file can maintain consistent styling across one or more web pages. Hence, that is what makes CSS a superior approach for styling and designing websites.
